Historique

THE HISTORY OF CRYOANALGESIA

An Anglo-Saxon monk uses cold as a local anesthetic.

1050

Dr. Irving S. Cooper develops device with hollow tube to deliver pressurized nitrogen and achieve -190°C at the tip.

1961

Lloyd et al. proposes that cryoanalgesia is superior to other methods of peripheral nerve destruction.

1976

2013

The Iovera® treatment system is launched. It delivers targeted cold to a peripheral nerve, immediately relieving pain.

400 BC

Hippocrates uses cold to relieve swelling, bleeding and pain.

1899

Campbell White is the first to employ refrigerants for medical use.

1967

Setrag Zaccarian introduces a hand-held self-pressurized cryogen spray device.

<https://iovera.com/providers/>

Sonde de cryothérapie

- ▶ Extrémité étanche
- ▶ Gaz: N₂O ou CO₂
- ▶ Acheminement gaz 600-800 psi
- ▶ Canule interne d'évacuation 10-15 psi
- ▶ Effet Joule-Thomson
- ▶ Isolation électrique distale
- ▶ Neurostimulateur
- ▶ Thermistor
- ▶ Introducteur (ex. cathéter IV 12-16G)

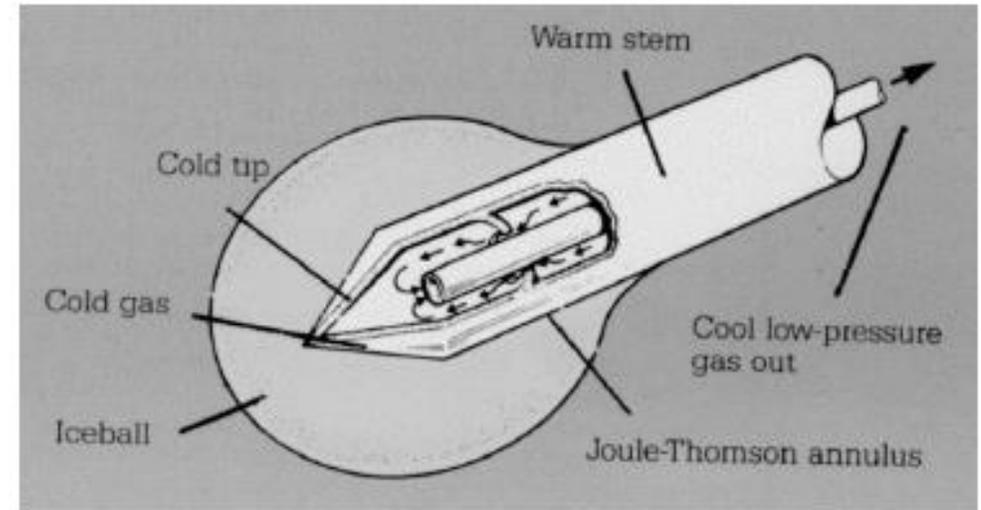

Figure 5. Joule-Thomson effect (image courtesy of Epimed).

Exemples de modèles de sondes

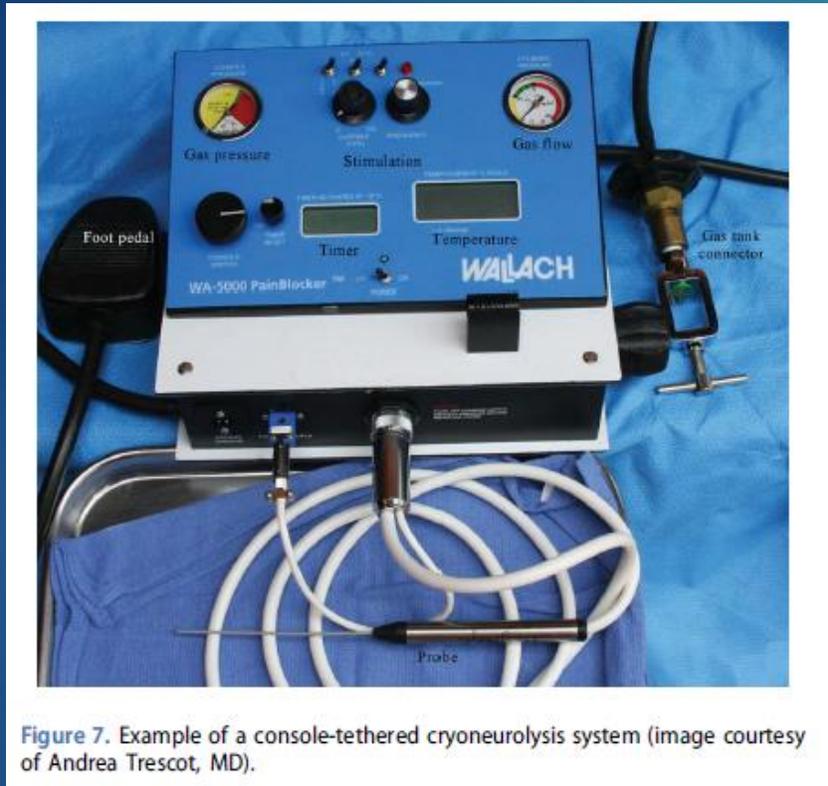

Table 2. Table of available cryoprobes for cryoneurolysis.

Cryoprobe diameter	Needle gauge	Ice ball size (mm)
Portable device [41]		
0.7 mm	22G	9.4 × 5.4 oval
0.4 mm	27G	5.7 × 7.8 oval
Console-tethered device [37]		
2.0 mm	14G	5.5 ball
1.4 mm	17G	3.5 ball

Physiopathologie de la cryoneurolyse

Formation de cristaux de glace intra-
et extracellulaires

Destruction des vasa nervorum

Œdème endoneural sévère dans les
90 minutes

Dégénéscence wallérienne (axone
et myéline)

Anatomie d'un nerf périphérique

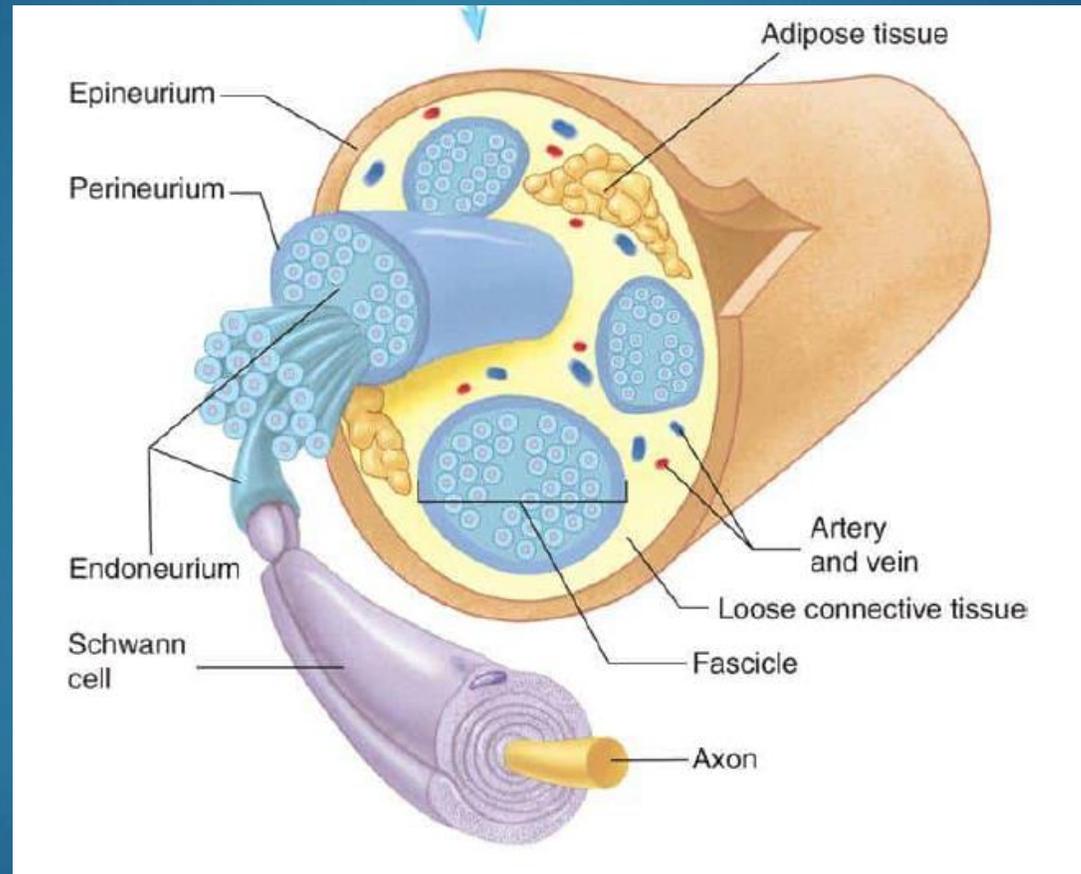

Table 1. Nerve injury as a function of cold [5,7].

Reversible	
First degree Neuropraxia – interruption of conduction; short recovery time	+10 to -20°C
Second degree Axonotmesis – Loss of axon continuity; Wallerian degeneration; preservation of endoneurium, perineurium and epineurium	-20°C to -100°C
Nonreversible	
Third/Fourth degree Neurotmesis – loss of axon continuity; some loss of continuity of endoneurium and perineurium	-140°C and colder
Fifth degree Transection (severe neurotmesis) – gross loss of continuity	Not possible with cryoneurolysis

Classification de Sunderland

Mécanismes complémentaires

- ▶ Analgésie fréquemment prolongée par rapport à la régénérescence neurale
 - ▶ Activation des voies descendantes inhibitrices
 - ▶ Blocage des neurotransmetteurs excitatoires
 - ▶ Blocage des canaux sodiques
 - ▶ Réhabilitation physique facilitée dans l'intervalle

Déterminants d'une lésion efficace

Bloc
diagnostique
méticuleux

Proximité du nerf
ciblé

Calibre de la
sonde

Taille de la
sphère de glace

Vitesse de gel et
de dégel

Durée de la
cryoneurolyse

Température des
tissus avoisinants
(*local heat sink*)

3-6 mm de
longueur de
lésion

Déroulement de la procédure

Lésion-type:
2-3 cycles de
2-4 minutes,
avec 30
secondes de
dégel

Inconfort ad
30 secondes,
soulagement
subséquent

Douleur
persistante:
via fibres non-
myélinisées
(trop loin du
nerf)

Ne jamais
mobiliser la
sonde avant
le dégel!

Avantages vs. thermolésion /transsection /neurolyse chimique

- ▶ Périnèvre et épinèvre préservés
- ▶ Membrane basale des cellules de Schwann
- ▶ Structure guidant la régénéscence axonale (1-4 mm / jour)
- ▶ Régénéscence malgré lésions répétées
- ▶ Théoriquement, absence de formation de névrome

- ▶ Peu de cascade inflammatoire

- ▶ Maintien des tissus conjonctifs, musculaires et vasculaires

- ▶ Point d'ébullition des gaz = plancher thermique
 - ▶ N2O -88 Celsius et CO2 -79 Celsius

Contre-indications

REFUS DU
PATIENT

GLOBULINÉMIE

URTICAIRE AU
FROID

RELATIF; VISAGE
(ESTHÉTIQUE)

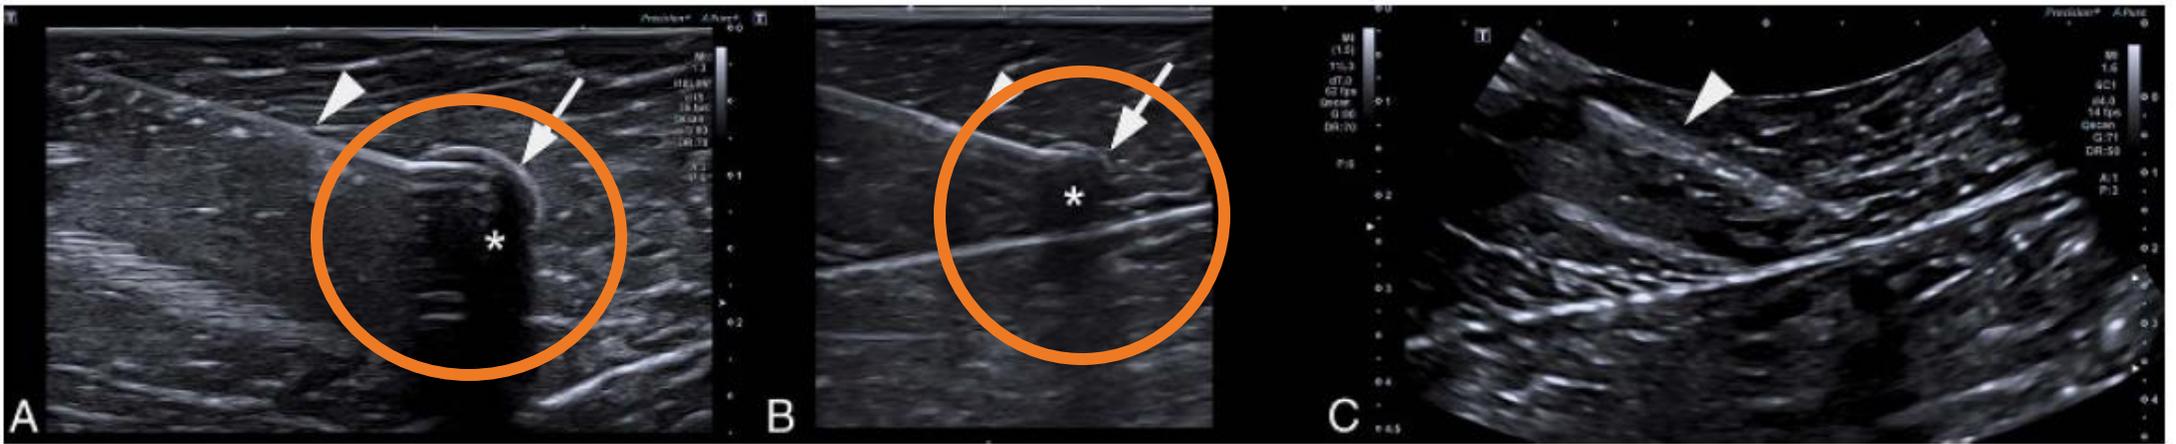

Modèles in vitro

Wolter 2017: bain de NaCl 0,9% et os de mouton

- Passer de -50 à -70 Celsius double la taille de la sphère de glace
- Allonger la durée de 30 à 120 sec.: 161%
- Augmenter le calibre de la sonde: 400 %
- Peu d'impact de l'angulation (sonde / os)

Birkenmaier 2010: boîte de gel agar

- Comparaison éventuelle de thermo- et cryolésion(s)

Modèle ex-vivo

Kastler A. et al., Reg Anesth Pain Med 43(6): 631-633.

Modèle animal

Nerf sciatique du rat Sprague-Dawley

**Laboratoire de Dartmouth
(1991-1995)**

Modèle comportemental de douleur
neuropathique
Aucune composante sympathique

***Nerve growth factor* augmenté dans
la corne dorsale (Ju et al, 2012)**
